Background

The protein encoded by this gene is a cell surface glycoprotein involved in leukocyte migration, T-cell adhesion, ganglioside GM1 and transmembrane protein transport, and T-cell death by a caspase-independent pathway. In addition, the encoded protein may have the ability to rearrange the actin cytoskeleton and may also act as an oncosuppressor in osteosarcoma. This gene is found in the pseudoautosomal region of chromosomes X and Y and escapes X-chromosome inactivation. There is a related pseudogene located immediately adjacent to this locus.

Validation Data

Flow cytometry: 1×10^6 U266 cells (negative control, left) and Human PBMC (right) were surface-stained with FITC Rabbit anti-Human CD99 mAb (A26936, 5 μ l/Test, orange line) or FITC Rabbit IgG isotype control (A25616, 5 μ l/Test, blue line). Non-fluorescently stained cells were used as blank control (red line).
