Background

This gene encodes an immune inhibitory receptor ligand that is expressed by hematopoietic and non-hematopoietic cells, such as T cells and B cells and various types of tumor cells. The encoded protein is a type I transmembrane protein that has immunoglobulin V-like and C-like domains. Interaction of this ligand with its receptor inhibits T-cell activation and cytokine production. During infection or inflammation of normal tissue, this interaction is important for preventing autoimmunity by maintaining homeostasis of the immune response. In tumor microenvironments, this interaction provides an immune escape for tumor cells through cytotoxic T-cell inactivation. Expression of this gene in tumor cells is considered to be prognostic in many types of human malignancies, including colon cancer and renal cell carcinoma. Alternative splicing results in multiple transcript variants.

Validation Data

Flow cytometry: 1X10⁶ Human PBMC (untreated,left) and Human PBMC (treated with 5 µg/mL PHA for 72 hours,right) were surface-stained with ABRlo® 488 Rabbit anti-Human/Monkey CD3 mAb (A26283,5 µl/Test) and PE/Cyanine7 Rabbit anti-Human PD-L1/CD274 mAb (A28068,5 µl/Test,). Cells in the lymphocyte gate were used for analysis.
