Background

The protein encoded by this gene is a cytokine that controls the production, differentiation, and function of macrophages. The active form of the protein is found extracellularly as a disulfide-linked homodimer, and is thought to be produced by proteolytic cleavage of membrane-bound precursors. The encoded protein may be involved in development of the placenta. Alternate splicing results in multiple transcript variants.

Immunogen Information

Immunogen
Recombinant fusion protein containing a sequence corresponding to amino acids 33-190 of human M-CSF (NP_000748.4).
